

**SE LAB 2**  
**PES1UG24CS697**  
**UTTAM K R**

**Epic 1: Loan Request Management**

Description: Enable borrowers to submit loan requests with the required loan amount, purpose, employment details, and preferred repayment method for lender review.

**Story: Submit Loan Request**

Description: As a borrower, I want to submit a loan request with the loan amount, purpose, employment details, and preferred repayment method, so that lenders can review my loan request.

**Epic 2: Credit Risk Assessment**

Description: Enable the system to calculate borrower credit risk ratings using debt-to-income ratio, repayment history, and employment stability.

**Story: Calculate Borrower Credit Risk**

Description: As a lender, I want the system to calculate a borrower's credit risk rating using debt-to-income ratio, repayment history, and employment stability, so that I can assess the borrower's repayment risk before approving a loan.

**Epic 3: Repayment Schedule Management**

Description: Enable the system to automatically generate structured repayment schedules containing due dates, repayment amounts, and outstanding balances for loans.

## Story: Generate Repayment Schedule

Description: As a borrower, I want the system to automatically generate a structured repayment schedule showing repayment amounts, due dates, and outstanding balance, so that I can clearly understand my repayment obligations.

## Epic 4: Payment Warning and Default Alerts

Description: Enable the system to notify borrowers about upcoming repayments and issue default warnings when repayments become overdue.

## Story: Send Repayment and Default Warnings

Description: As a borrower, I want to receive reminders before a repayment is due and warnings when a repayment becomes overdue, so that I can make payments on time and avoid default.

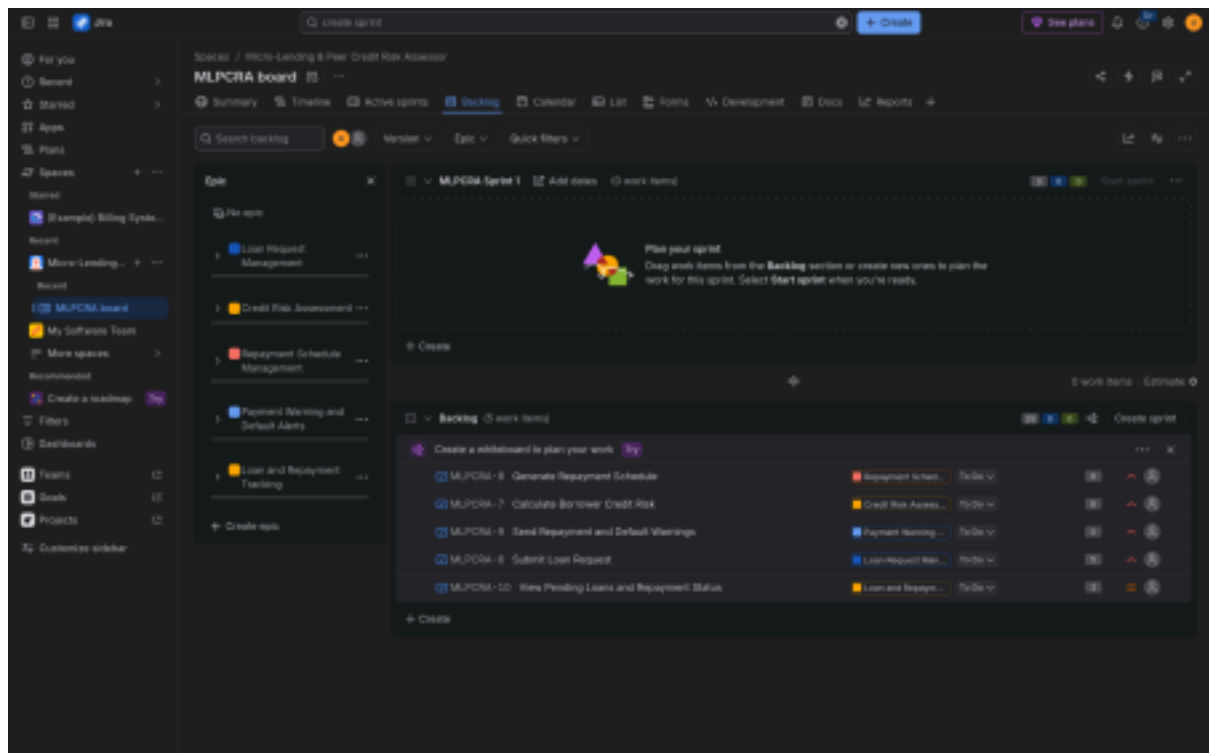

## Epic 5: Loan and Repayment Tracking

Description: Enable users to view their pending loans, repayment schedules, upcoming payments, and repayment status through their profile.

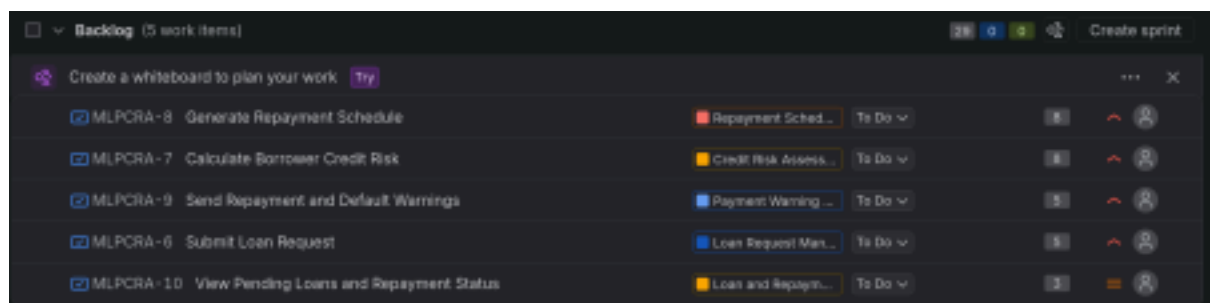

## Story: View Pending Loans and Repayment Status

Description: As a borrower, I want to view my pending loans, repayment schedules, upcoming payments, and repayment status from my profile, so that I can easily track my active loans and payment obligations.

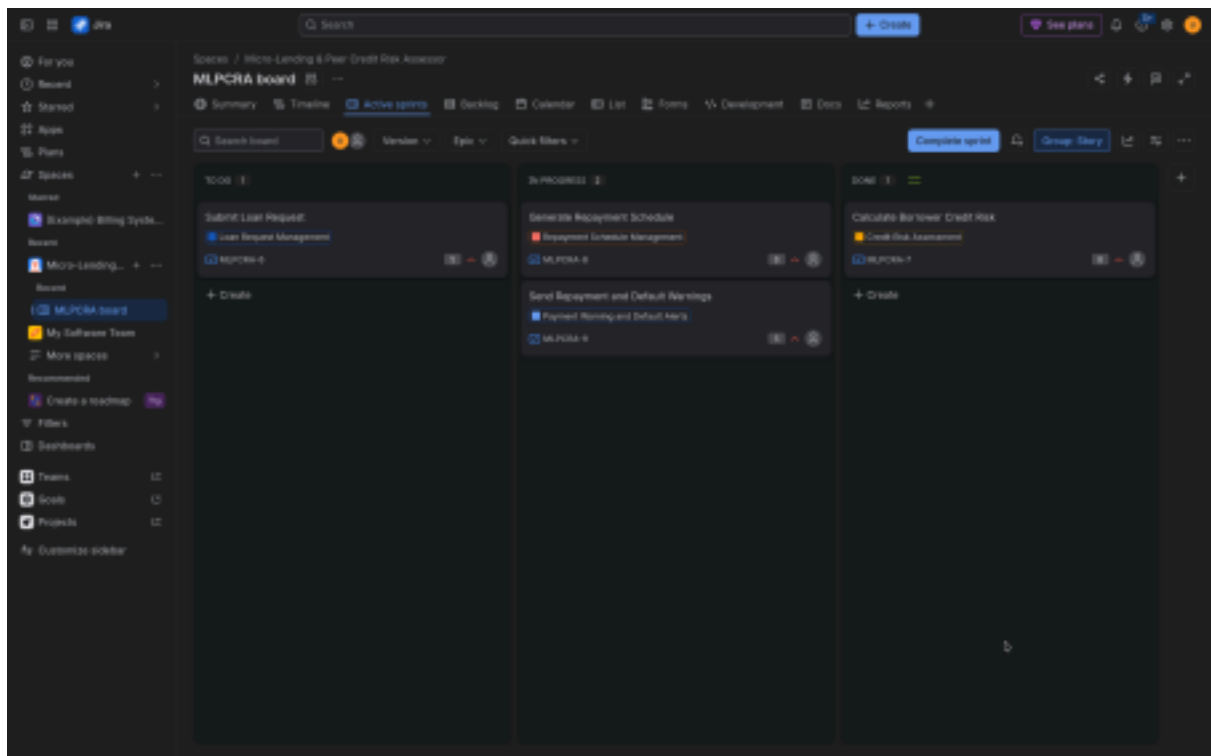

## **Epics**

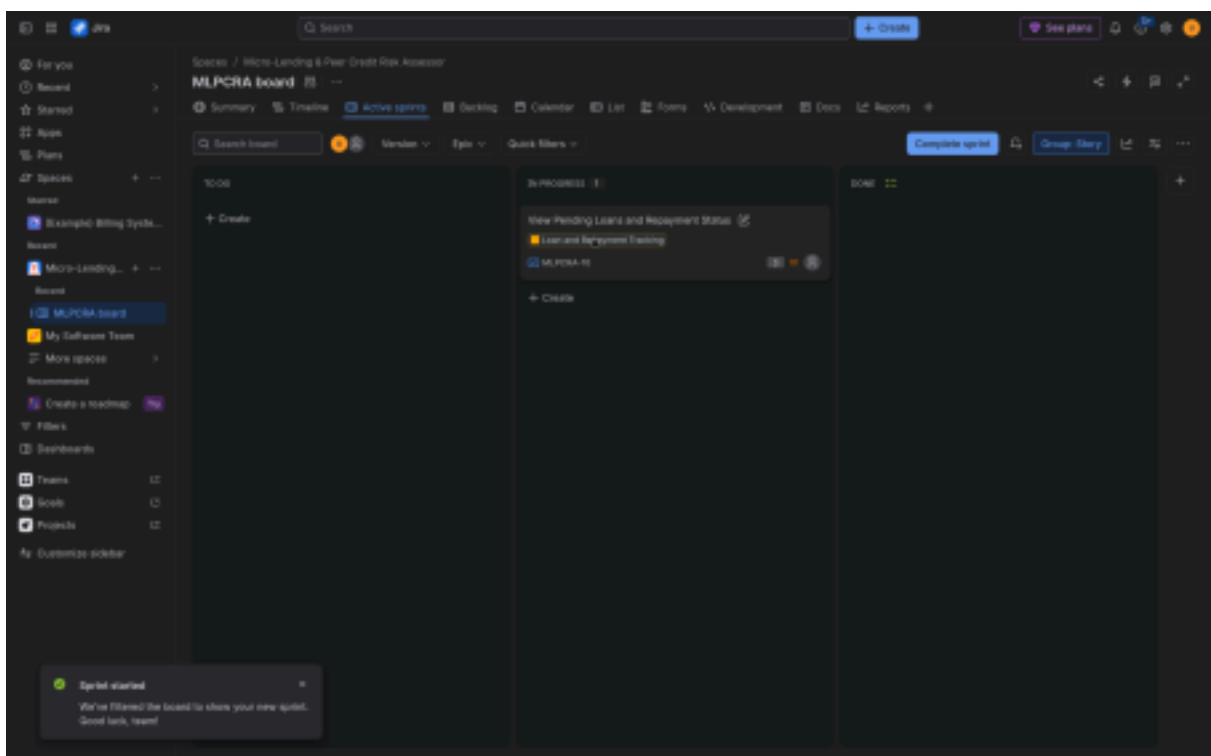

Story points:

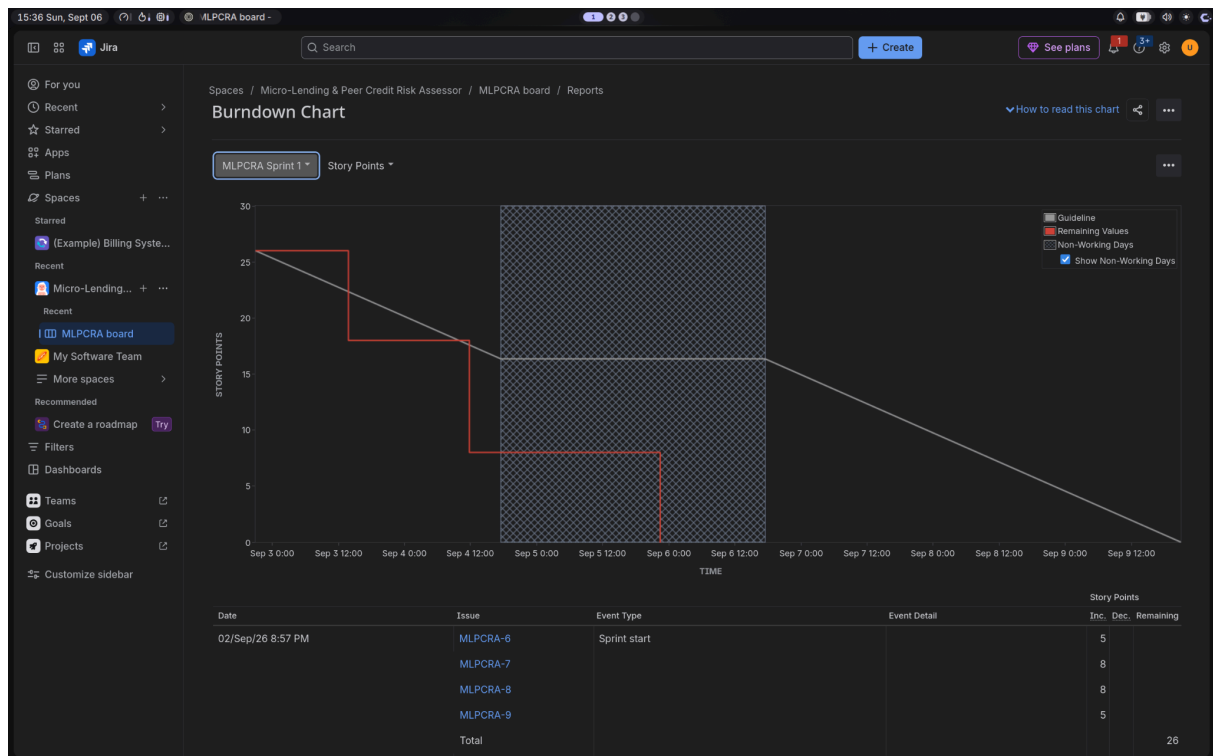

Active sprint view 1

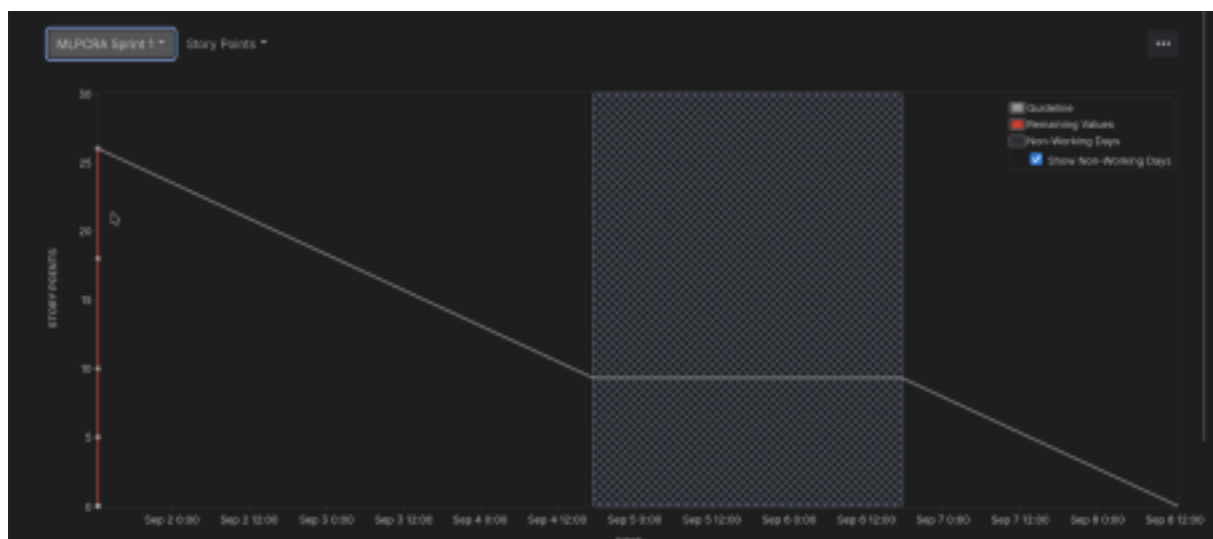

Active sprint view 2

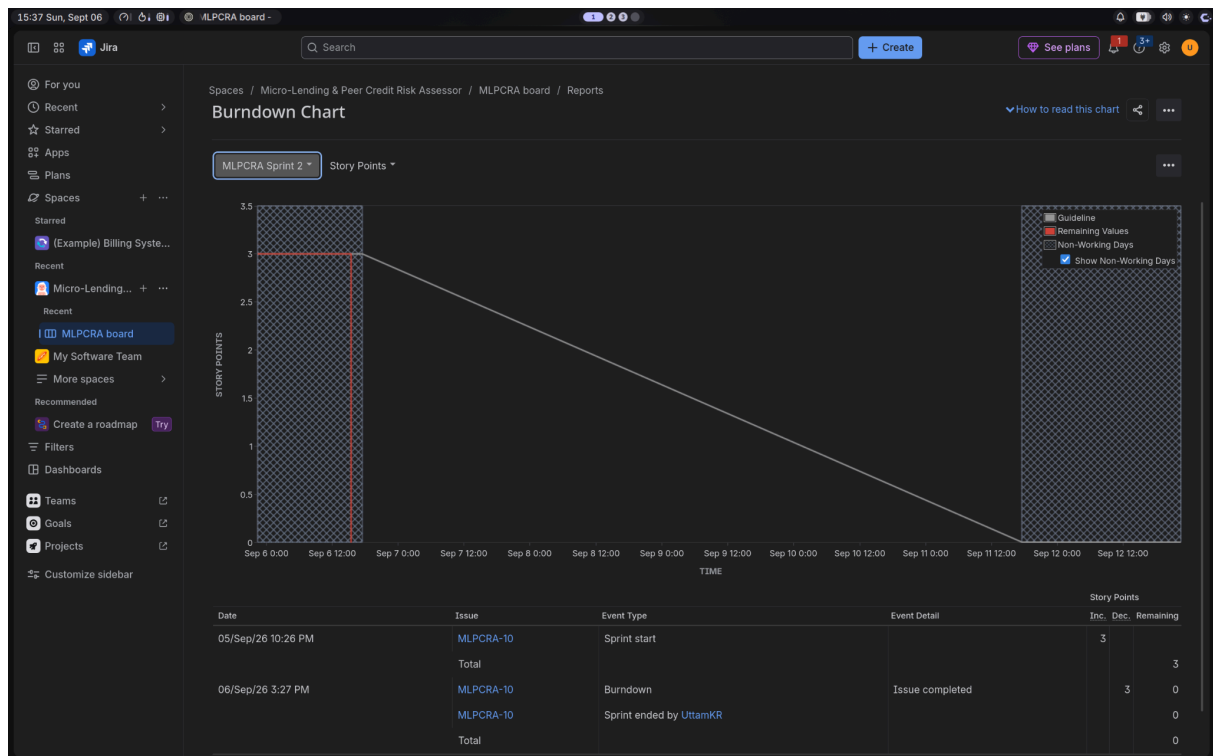

Burndown chart 1 over a week

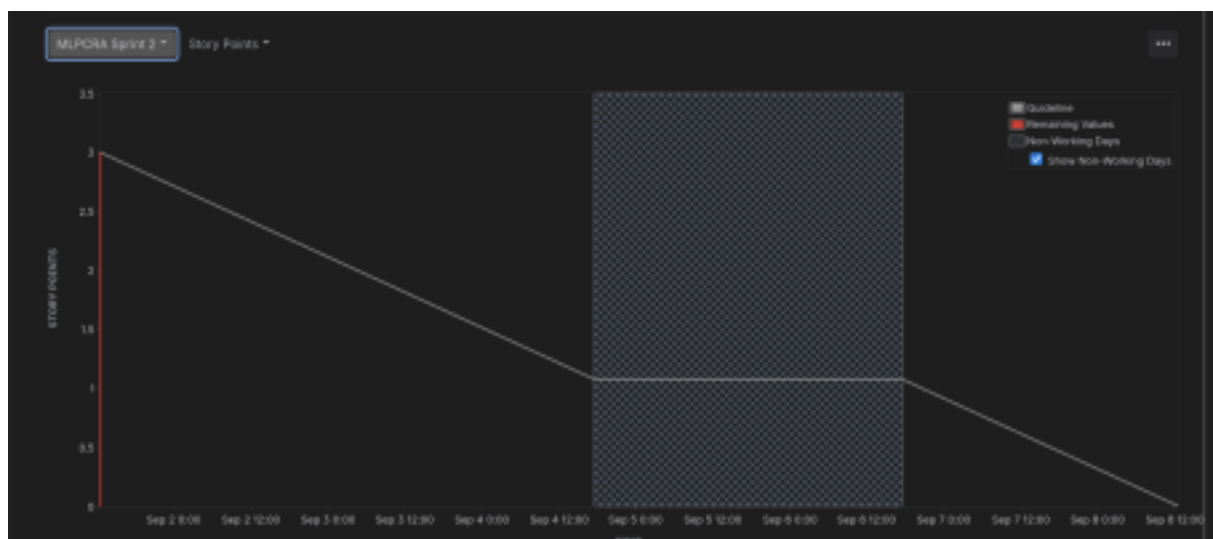

**Burndown chart 1 one day simulation**

**Burndown chart 2 over a week**

## Burndown chart 2 one day simulation

## Reflections

1. Did your estimations reflect the actual effort?

Yes, I believe that the estimations were close to reality. The story points for such significant tasks as Calculation of the borrower's credit risk and Preparation of the repayment

schedule were 8, while the ones for smaller and easier tasks was 3 or 5. When the sprint was done, I could see that the estimations were justified by the actual effort. Story points should be used to compare the amount of work and complexity rather than actual hours.

## 2. Was your backlog well-prioritized?

Yes, it was. The most critical functions in the system were given the highest priority. The ability to view pending loans has Medium priority since it is not critical but is still a helpful feature. Moreover, the lab recommends prioritizing features based on their impact on the user.

## 3. How did your simulated sprint aligned to your plan?

The simulated sprint aligned to my plan since all the main tasks were completed. Firstly, the most complex and critical stories were taken from the backlog to the sprint. Then, in the next two iterations, the stories were moved from To Do to In Progress to Done. Thus, everything was well-planned, and all important features were taken to the current sprint. The lab actually recommends simulating the transition of the stories between the three states.

## 4. What did you learn about your team's capacity from the burndown chart?

The burndown chart allowed me to see how much work the team did during the sprint. Since everything was completed, I could see that the capacity of the team was well estimated. Burndown charts are helpful in comparing the actual progress with the initial plan. That way, it is easier to see if the team did enough work during the sprint. Jira allows one to visualize this information to have a better perception of how much work is left. show work remaining and help judge whether the team is likely to finish within the sprint.
